

# AI-Powered EULA and Terms & Conditions Simplifier

*Project Abstract*

## **Abstract**

Most users accept End User License Agreements and Terms & Conditions without reading them. The documents are long, full of legal jargon, and often hide clauses on data sharing, tracking, auto-renewal, and liability. This leaves people unaware of what they are agreeing to and weakens informed digital consent.

We propose an AI-powered application that converts complex EULAs and T&Cs into short, plain-language summaries. The system extracts the text from an app or web page and uses natural language processing to split it into key clauses. It then explains each clause simply and flags high-risk terms such as data collection, third-party sharing, and subscription or cancellation conditions. An overlay feature displays these summaries directly alongside the original agreement, so users get clarity at the moment of consent without switching screens. Support for regional languages can make the tool accessible to users who are not comfortable with legal English.

By turning dense legal text into clear, actionable information, the solution improves transparency, supports consumer awareness, and encourages safer digital decisions.
